Pathpal

Find your way inside. Follow your companion.

Indoor navigation on Snap Specs. Step-free, hands free, offline.

Indoor navigation is still hard

Signs and wall maps

Tedious to follow, hard to remember.

No GPS indoors

Phone maps stop at the door. Signal is often weak.

Stairs you didn’t expect

In a wheelchair or with a stroller, you find them too late.

WHAT IT IS

A companion on your glasses that walks you there

One map per building

Floors, shops, lifts and stairs in one file.

A companion to follow

A dog or a robot, more to come. Just follow it.

Offline routing

Once the map is on the glasses, you navigate without internet.

What it does

Walk or Step-Free

Step-Free uses only lifts and ramps.

AI voice search

Say where you want to go. It plans the stops.

Speech transcription

What people say to you, as text, translated.

An AR market

Free walk points out shops you like. Look at one to see its offers.

Play while you wait

Throw your companion a treat, make it jump.

Map builder

A utility: walk a place once to map it.

THE HERO STORY

An airport, in a wheelchair

1

Say it

“Coffee and a bathroom before my flight at gate 12C.”

2

Follow

Café, accessible toilet, Gate C12. Lifts only. The robot leads.

3

Hear

A Spanish announcement, captioned in English.

4

Talk

The gate agent speaks Spanish. You read English.

AND FOR EVERYONE

A mall, just walking

Follow the dog

“Take me to the Bakery.” The dog leads, across floors.

Free walk

No destination. The robot points out shops you like.

Sponsored shops post time-limited offers you see through your Specs.

Who it’s for

Who	What Pathpal gives them
Anyone in a big building	Accurate indoor directions, eyes up, hands free
Wheelchair, stroller, luggage, crutches	Step-Free routes that never meet a stair
Deaf or hard of hearing	Live captions of what people say to them
Travellers abroad	Translation of what they hear, into their language
Places with weak signal	Routing that works offline once the map is saved
Shops and venues	A new AR shop window: pay to be pointed out, post time-limited offers. Venues license the maps.

How it was built

Planned

Devpost Learn /plan-lens, then OpenSpec specs.

Test first

TDD: Node tests, and LEAF tests pressing real buttons in the preview.

Route planner

Dijkstra over the map. A* ready for big maps.

Specs kits

Spectacles Interaction Kit and UI Kit, in TypeScript.

Open assets

Voice by Kokoro (open TTS). CC0 3D models.

Maps are data

A new building is a new JSON file, not new code.

In the preview, speech, AI, translation and the sign scan are labelled stand-ins. No Specs hardware was used.

What comes next

Your announcements

Knows your flight. Hears your gate change or your name, re-routes.

Add-on: blind travellers

A whole trip by voice, then obstacle warnings from the camera.

Whole airports

A* search on the glasses, maps loaded by area.

More map formats

Import floor plans and existing venue maps. SVG export works today.
